

1. JavaScript essentials

You can move through this quickly because you already understand programming.

- let, const
- Data types
- Operators
- if/else
- Loops
- Functions
- Arrow functions
- Scope
- Template literals
- Destructuring
- Spread/rest
- Truthy/falsy
- === vs ==

2. DOM ★★★★★

This is where I'd spend more time.

- getElementById
- querySelector
- querySelectorAll
- textContent
- innerHTML
- value
- style
- classList
- Creating/removing elements
- Attributes
- Forms

3. Events ★★★★★

- addEventListener
- click
- input
- change
- submit
- keydown / keyup
- Event object
- Event bubbling
- Event delegation
- preventDefault

4. Arrays & Objects ★★☆☆

You don't need to spend weeks here, but you need to be comfortable with:

- Arrays
- Objects
- Array of objects
- map()
- filter()
- find()
- some()
- every()
- reduce()
- forEach()
- Destructuring
- Spread operator

This becomes **very important when working with API responses**.

5. Async JavaScript ★★★★★

This is **critical for frontend development**.

- Callbacks — understand the concept
- Promises
- async/await
- try/catch
- fetch()
- HTTP requests
- JSON
- GET
- POST
- PUT
- DELETE
- Handling loading/error states

As a Java developer, you'll probably find the HTTP/API concepts familiar.

6. Browser APIs

Learn the commonly used ones:

- localStorage
- sessionStorage
- URL
- FormData
- setTimeout
- setInterval

7. Modules ★★★★★

Very important before moving into frameworks:

- export
- import
- Default vs named exports
- Module structure

8. Modern JavaScript ★★★★★

You don't need every obscure feature.

Focus on:

- Destructuring
- Spread/rest
- Optional chaining ?.
- Nullish coalescing ??
- Default parameters
- Arrow functions
- Modules
- Promises
- async/await
